RB-109 Idempotency cache

Service

idem-cache is the Redis cluster that remembers each payment request's idempotency key for 24 hours, so a retried request is never charged twice.

Alert: IdemCacheMemoryHigh

Fires above 85% memory. Keys expire on their own after 24 hours, so a spike usually follows a traffic spike. Add a shard with redisctl add-shard idem-cache before memory reaches 95%.

Never flush

Never run FLUSHALL on idem-cache. Every retried payment in the next 24 hours could be charged twice.

Failover

If the primary node dies, the Redis sentinel promotes a replica within 30 seconds. Payments in that window are declined and retried by merchants; none is charged twice.
