RB-106 FX rates service

Service

fx-rates pulls exchange rates from two providers every minute and serves them to pricing and payouts. Rates older than 10 minutes are stale.

Alert: FxRatesStale

Fires when the newest rate is more than 10 minutes old. Check both provider panels: if one provider stopped, fx-rates already uses the other.

Freeze rates

If both providers fail, freeze the last good rates with fxctl freeze --max-age 2h. Pricing keeps working on frozen rates for two hours; after that, cross-currency checkout is turned off.

Manual rate

Never type a rate in by hand. A wrong manual rate has to be refunded to every customer it touched.
