RB-107 Merchant webhook dispatcher

Service

hook-dispatcher sends payment events to merchants' webhook endpoints and signs each one with the merchant's secret.

Retries

A failed delivery is retried with backoff: after 1 minute, 10 minutes, 1 hour, then every 6 hours. After 72 hours of failures the endpoint is disabled and the merchant is emailed.

Replay events

To resend what a merchant missed, run hookctl replay --merchant <id> --since <time>. Replays are signed again and carry the original event id, so the merchant can drop duplicates.

Disabled endpoint

A merchant whose endpoint was disabled must fix it and press Re-enable in the dashboard. Support cannot re-enable it for them; that stops us sending events to a URL nobody owns.

Signing secret

Rotate a merchant's signing secret only when they ask or it has leaked. The old secret keeps working for 24 hours so the merchant can deploy the new one.
